**Software Quality Assurance
Methodology for Hybrid Waterfall and
Agile Development (HWAM)**

Keping Liu

- 14+ years at Software Quality Assurance, Technical Leader, Intel Cooperation, Shanghai, China.
- Certified CMMI assessor, ISO internal assessor, ASPICE internal assessor, CSQE, 6 Sigma Orange Belt and CPMP.
- Knowledge Base: PMP, ISO9000, CMMI, TS16949, ASPICE, VDA6.X, 6 Sigma, CSQE.
- Master Degree in Computer Science and Technology from Central South University in China.

Co-Author: Felix Eu, Ooi Mei Chen, Peh Wei Wooi

What is Software Quality Assurance Methodology?

- **Software Quality Assurance** is a systematic software practice, which used to **monitor** and **control** the processes and work products, to **comply with** defined standards, and **meet** software release targets.

Evolvment - HWAD

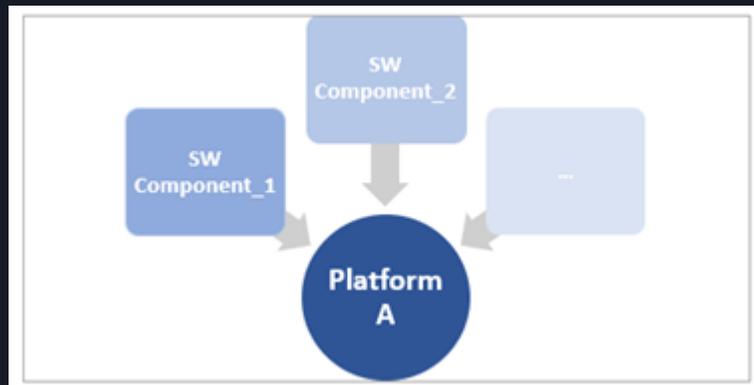

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

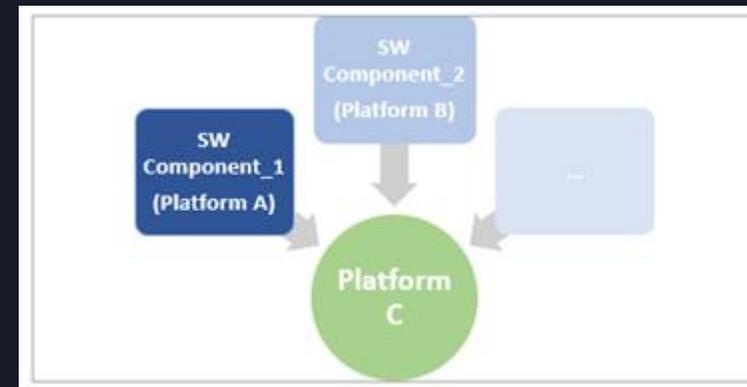

Hybrid Waterfall and Agile Development (HWAD)

- Waterfall and Agile software development life cycles used at the same time by different software components within a big platform, which is called **Hybrid Waterfall & Agile Development (HWAD)**.
- **Team structure**

- A platform can have multiple software components within it.

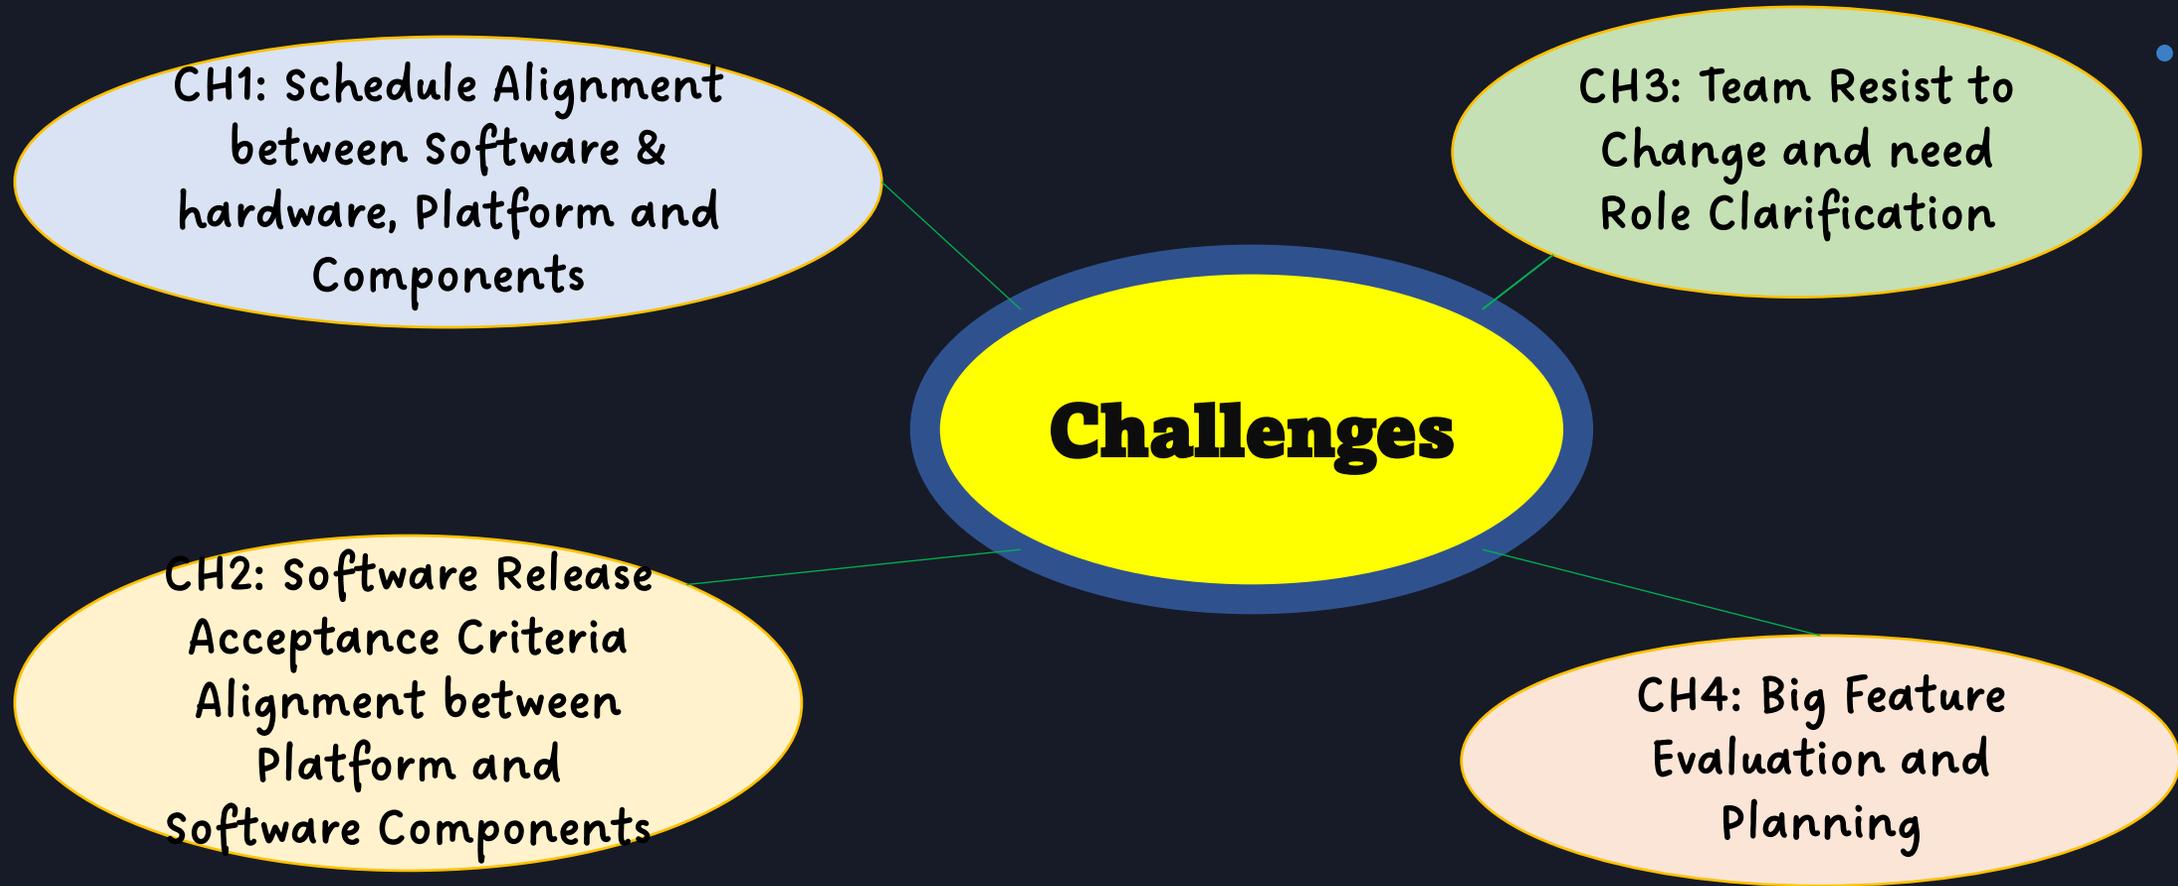

- While a platform could turn into a software component for another platform when it becomes a base for others.

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

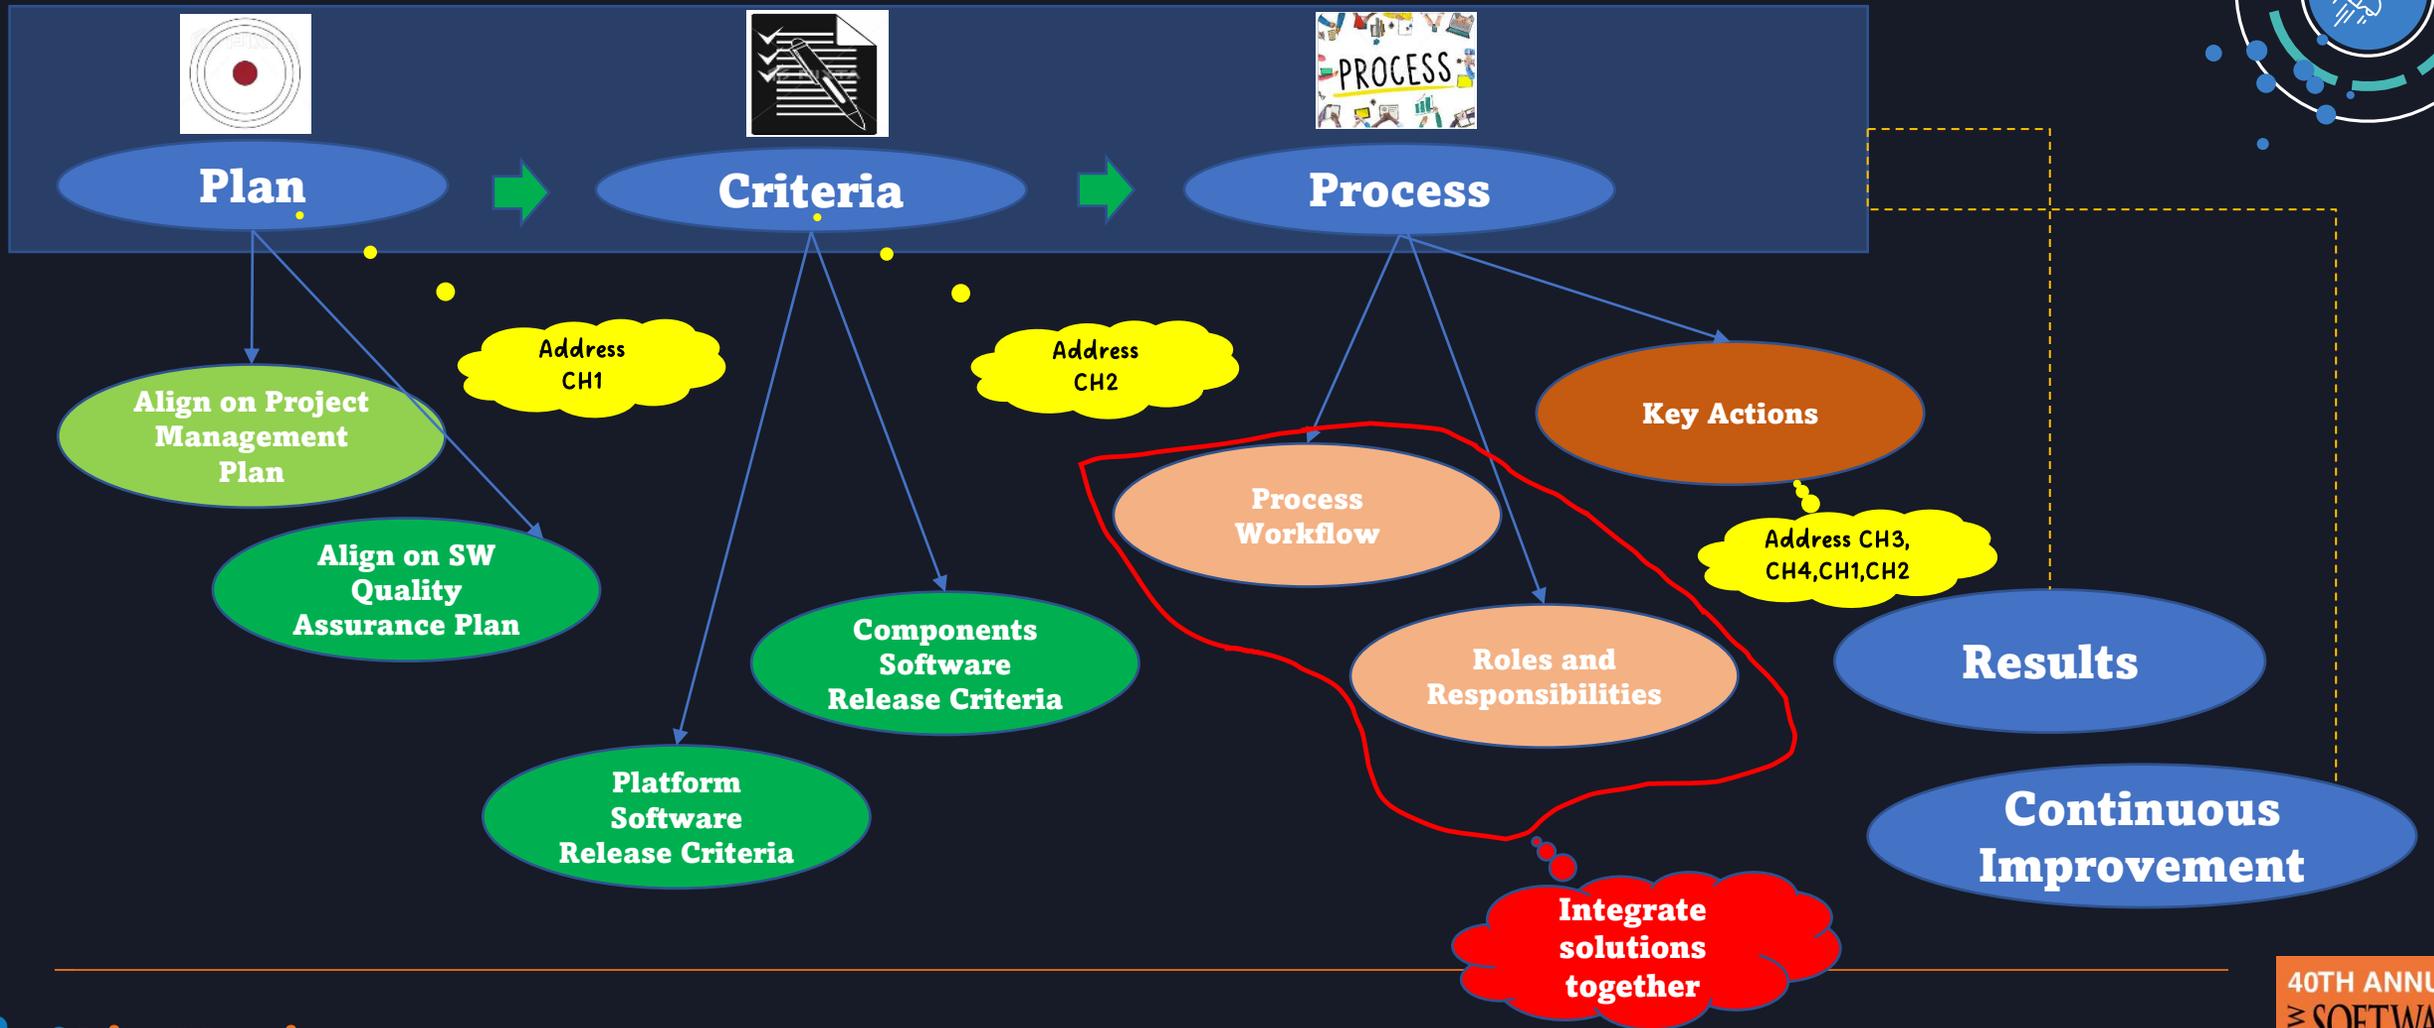

What are the Challenges of HWAD?

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

HWAM Overview

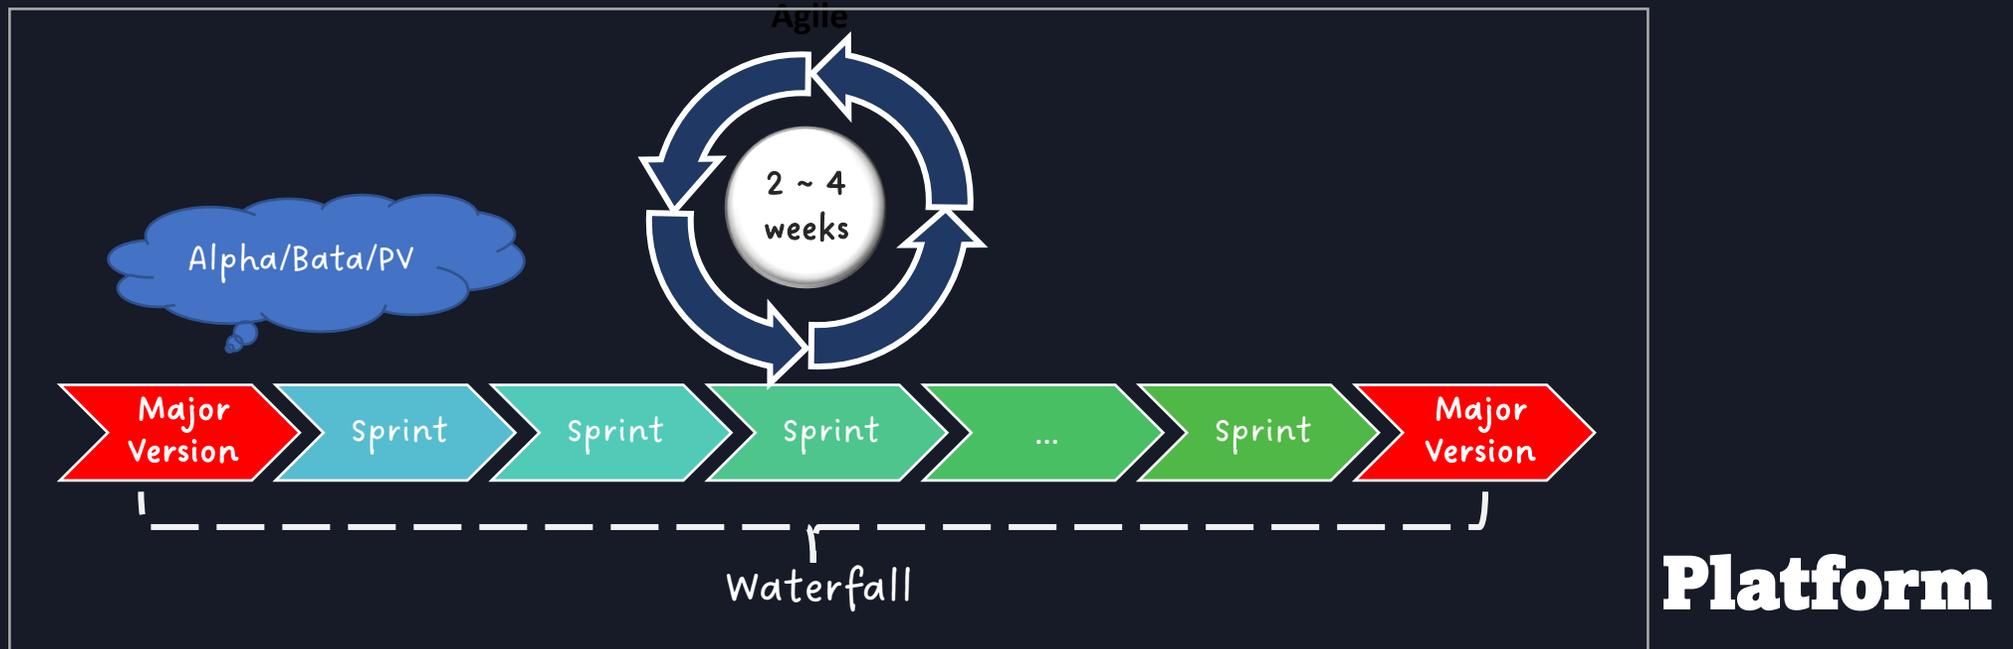

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

HWAM – Project Planning

- **Map** a certain number of sprints to Waterfall milestones and released it as a **major version**.
- Others will be treated as **intermediate releases** like engineering releases.
- **A major version can be triggered** once a **big feature is complete** or **several big features are integrated**.

Liu Keping

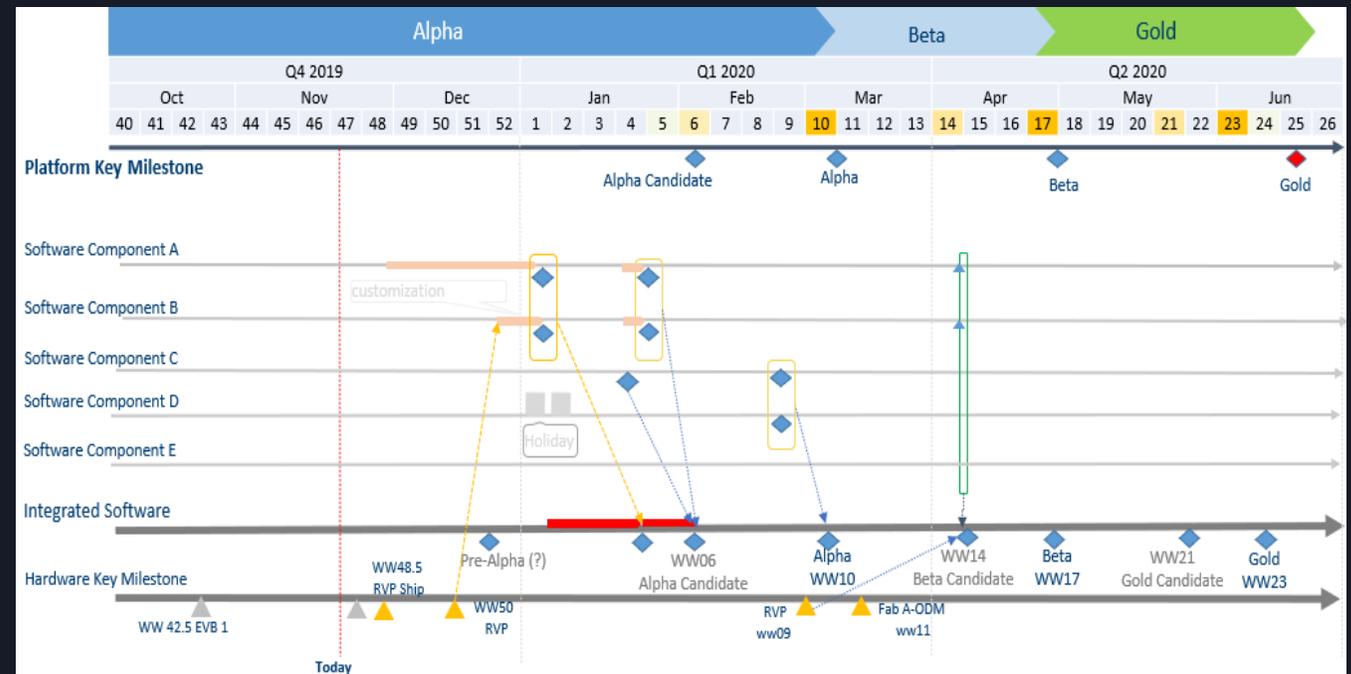

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

HWAM – Schedule Alignment

- ❖ Establish **formal** communication channels, perform **risk analysis** and create **mitigation plans** to **narrow down** the impact of hardware.
- ❖ Align hardware **testing** to software **'Iterations'** as close as possible to get hardware function to be tested in a timely manner.
- ❖ Create a **dependency matrix** to align release schedule. Make sure software components release **meet platform release target**. Get software components team **commitment** to the release schedule.

Example: Dependency Matrix

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

HWAM - SW Release Acceptance Criteria

- Create 2 sets of release qualification criteria:

Major Version Release

For each Major Version Release, apply standard Waterfall software release qualification criteria.

See slide15 for details.

VS

Intermediate Sprint Release

For each Intermediate Sprint Release, strategically decompose and reform software release criteria to meet Agile methodology needs.

See slide16 for details.

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

HWAM - SW Release Acceptance Criteria

Typical software release qualification checkpoints covered in a standard Waterfall development:

Major Version Release

HWAM - Key Action

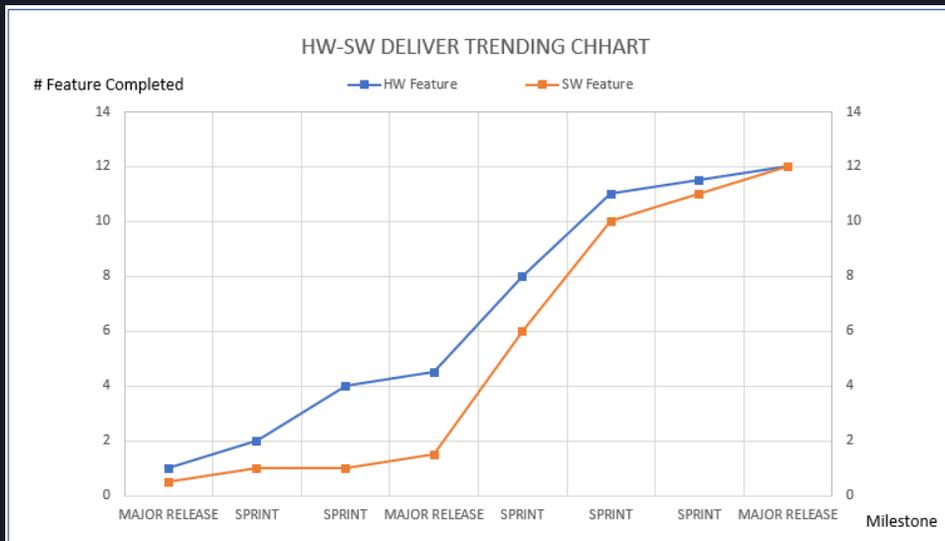

Activity	Refine Project Management Plan to fit for HWAD
Purpose	The purpose of this activity is to refine the Project Management Plan to fit for HWAD.
Start criteria	Project Management Plan in place
Input work products	<ul style="list-style-type: none"> Project Management Plan
Responsible	<ul style="list-style-type: none"> Platform Software Quality Engineer, Project Manager
Action list	<ul style="list-style-type: none"> Add a formal evaluation task in Microsoft Project Planning (MPP) at the beginning of a project to see if the Agile development methodology was fit for the current project. (CH3) Add Agile development methodology (E.g., Scrum Master, Product Owner, etc.) training to the project training plan. (CH3) Add big feature evaluation and planning training to the project training plan. (CH4) Create software component and platform dependence matrix to align software release schedule. (CH1) Create hardware and software dependence matrix to align hardware and software release schedules. (CH1) Create a formal communication channel to synchronize hardware and software on schedule, scope, and resources. (CH1) Perform risk analysis and mitigation plans to narrow down the impact of hardware. (CH1) Add retrospective meetings for each major milestone in MPP (CH2).
Output work products	Refined Project Management Plan; Refined Microsoft Project Planning
Exit criteria	Refined Project Management Plan; Refined Microsoft Project Planning in place
Work Instruction	Hybrid Waterfall and Agile Execution Checklist

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

HWAM – Implementation Result

- Hardware and software delivery **schedule trend** converged by the 8th sprint.

Implementation	Result (Before)	Result (After)	Improvement
Release cycle and Human resource	SW 26 platform releases within 1 year HW 6 releases within 1 year	12 platform releases with both working HW and SW within 1 year	The release cycle and human resource usage are decreased by 62% respectively
Customer evaluation	On average, customer validation feedback was received twice and feedback is collected late in the delivery lifecycle.	Customer validation feedback was collected ≥ 6 times throughout the product lifecycle (because of the aligned HW and SW schedule), including early, mid, and end of the delivery period.	Customer feedback received improved $\geq 300\%$

- Release cycle and human resource usage** decreased by ~62%.
- Customer feedback** received improved 300%.

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

Continuous Improvement

- **HWAM Gap Analysis and Continuous Improvement:**

Gap Analysis	Continuous Improvement
Sometimes it is hard to map HW and SW features to get a good schedule alignment.	Use a unified tool to track both HW and SW features in the same location. E.g., Using Jira which has the burndown chart report embedded.
Sometimes HW schedule cannot fit for SW schedule.	Plan additional SW releases to fit for HW release schedule. E.g., the HW B0 release has aligned the SW Alpha release, but the next HW B1 release does not have a corresponding SW release with it.
Process KPIs (key performance indicators, KPI) are not formally defined and measured.	Define formal process KPIs to monitor and control efficiency and quality, identify process gaps, and improve the process. E.g., considering execution velocity, feature completion, customer evaluation, effective communication... etc.

*HW: Hardware
* SW: Software

Liu Keping

Software Quality Assurance Methodology for Hybrid Waterfall and Agile Development

Summary and Key Takeaway

- Definition
- Independence, Plan, Criteria, Checklist
- Process Compliance and Product Compliance

Software Quality Assurance

- Traditional SDLC*
Waterfall and Agile
- Definition
- Team Structure

HWAD

- Major Challenges:
- Schedule alignment
 - Release criteria alignment
 - Resist to change
 - Big feature evaluation

HWAD Challenges

- Definition
- Address problem from 3 aspects: Plan, Criteria, Process
- Key Action

HWAM

*SDLC: Software Development Life Cycle
